

Installation & Setup

The Aqua Fuzion system consists of two components: The Aqua Fuzion unit and a commercial-rated oxygen concentrator which produces 97% oxygen.

The Aqua Fuzion can easily be adapted to an existing or new recirculation system. A bypass loop is created right after the pool or spa filter and heater, using 2" PVC plumbing. The injection point of the oxygen is directed downstream after the pool heater on the final return line back to the pool.

Aqua Fuzion can easily be adapted to accept Ozone at a later date without having to re-plumb the system. With the proper Ozone system, it will adapt in-between the oxygen concentrator and the Aqua Fuzion. Installation should only be done by a qualified Pure Vision Technologies contractor. Please call for a list of qualified contractors in your area.

Please refer to the Aqua Fuzion Installation Diagram Sheet for examples of Aqua Fuzion installed to systems with and without Ozone.
