

## Installation & Setup

The AquaGen Hyper Dissolved Oxygen System consists of two components:

1. The AquaGen unit
2. A commercially rated oxygen concentrator which produces 97% pure oxygen

By utilizing each of these components, the AquaGen system is designed to produce 97% pure atomized oxygen. This creates Hyper Dissolved Oxygen (HDO) levels ranging from 10-30ppm of residual oxygen in the water at all times.

The AquaGen system can easily be adapted to an existing or new recirculation system. A bypass loop is created right after the pool filter(s) by using 2" PVC plumbing on the inlet and outlet. The discharge injection point of the oxygen is directed downstream after the pools heater on the final return line back to the pool.
